    }

    temp.next = new NodeMahasiswa08(input, temp.next);

    if (temp.next.next == null) {

        tail = temp.next;

    }

}

}
}

```

Kode Program SLLMain08 :

```

Package PERTEMUAN11;

```

```

public class SLLMain08 {

    public static void main(String[] args) {

        SingleLinkedList08 sll = new SingleLinkedList08();
    }
}

```

```

Mahasiswa08 mhs1 = new Mahasiswa08("24212200", "Alvaro", "1A", 4.0);

Mahasiswa08 mhs2 = new Mahasiswa08("23212201", "Bimon", "2B", 3.8);

Mahasiswa08 mhs3 = new Mahasiswa08("22212202", "Cintia", "3C", 3.5);

Mahasiswa08 mhs4 = new Mahasiswa08("21212203", "Dirga", "4D", 3.6);

sll.print();

sll.addFirst(mhs4);

sll.print();

sll.addLast(mhs1);

sll.print();

sll.insertAfter("Dirga", mhs3);

sll.insertAt(2, mhs2);

sll.print();

}

}

```

Pertanyaan

1. Mengapa hasil compile kode program di baris pertama menghasilkan “Linked List Kosong”?

Jawab : Karena pada saat program pertama kali dijalankan, linked list masih belum berisi data apa pun. Di dalam class SingleLinkedList08, kondisi kosong dicek di method:

```

boolean                                IsEmpty()                                {
    return                             (head == null);
}

```

Nah, waktu object sll baru dibuat:

```
SingleLinkedList08 sll = new SingleLinkedList08();
```

nilai head = null, artinya belum ada node sama sekali.

Terus kamu langsung panggil:

```
sll.print();
```

Maka program masuk ke bagian ini:

```
if (!IsEmpty()) {
    ...
} else {
    System.out.println("Linked List Kosong");
}
```

Karena masih kosong → otomatis keluar tulisan "Linked List Kosong".

2. Jelaskan kegunaan variable temp secara umum pada setiap method!

Jawab : Variabel temp itu fungsinya sebagai penunjuk sementara (penjelajah) di dalam linked list.

fungsi temp:

- Untuk menelusuri isi linked list
- Untuk mencari node tertentu
- Untuk menyisipkan atau memodifikasi node tanpa merusak head

Kalau tidak pakai temp, kita bisa kehilangan referensi ke data awal (head), jadi program bisa error.

3. Lakukan modifikasi agar data dapat ditambahkan dari keyboard!

        sll.print();

        System.out.println("Program selesai.");

        sc.close();

    }

}

```

Pertanyaan

1. Mengapa digunakan keyword break pada fungsi remove? Jelaskan!

Jawab : Keyword break digunakan untuk menghentikan perulangan (loop) ketika data yang ingin dihapus sudah ditemukan dan berhasil diproses.

Pada method remove, program melakukan pencarian node berdasarkan nama. Saat node yang sesuai sudah ditemukan dan dihapus, maka tidak perlu lagi melanjutkan pencarian ke node berikutnya. Oleh karena itu, break digunakan agar loop langsung berhenti.

Jika break tidak digunakan, maka program akan tetap melanjutkan perulangan hingga akhir linked list, yang bisa menyebabkan:

- proses menjadi tidak efisien (membuang waktu),
- bahkan berpotensi error jika manipulasi data terjadi lebih dari sekali.

Jadi, fungsi utama break di sini adalah menghentikan proses setelah data berhasil dihapus agar lebih efisien dan aman.

2. Jelaskan kegunaan kode dibawah pada method remove

```
temp.next = temp.next.next;  
    if (temp.next == null) {  
        tail = temp;  
    }
```

Jawab : Kode tersebut berfungsi untuk:

1. Menghapus node dari linked list dengan cara melewati node tersebut
2. Menjaga agar pointer tail tetap benar jika node terakhir dihapus

TUGAS

Kode Program Mhs08 :

```
package PERTEMUAN11;
```

```
public class Mhs08 {
```

```
    String nim;
```

```
    String nama;
```

```
    String kelas;
```

```
    public Mhs08(String nim, String nama, String kelas) {
```

```
        this.nim = nim;
```

```
        this.nama = nama;
```

```
        this.kelas = kelas;
```

```
    }
```

```
